COMMISSIONER

The Commonwealth of Massachusetts

Department of Public Health

600 Washington Street

Boston 02111

August, 1981

To the Honorable Senate and
House of Representatives

I have the honor to submit herewith as required by Chapter 111, Section 2 of the General Laws, the one hundred and thirty-eighth annual report on statistics of births, deaths, fetal deaths, abortions, marriages, and divorces in Massachusetts for the calendar year 1979.

This is the sixteenth Annual Report of Vital Statistics published by the Department of Public Health, and is intended for administrative and research purposes connected with health programs and population studies.

Respectfully submitted,

Alfred L. Frechette

FOREWORD

This is the 138th Annual Report of Vital Statistics and the 16th prepared by the Department of Public Health. It tabulates Massachusetts births, deaths, fetal deaths, abortions, marriages and divorces occurring in the 1979 calendar year. This report is produced under the provisions of Section 2, Chapter 111 of the Massachusetts General Laws.

Statistics presented in this report are based primarily on resident data, However, marriage and divorce data reflect occurrences of these events within the Commonwealth. Statistics for deaths certified by medical examiners are also based on occurrence and are included in this report for the first time.

It is hoped that this report will be useful to a wide range of health data users in the Commonwealth. Questions concerning these data and requests for more detailed findings should be directed to the Massachusetts Department of Public Health, Division of Health Statistics and Research, Room 335 80 Boylston Street, Boston, Massachusetts 02116. Telephone (617)727-5542.

VITAL EVENTS

During 1979 there were 70,568 births and 51,797 deaths to residents of Massachusetts. Births increased 3% over 1978 (68,526) and reflect a rate of 11.9 per thousand population, somewhat lower than the national rate of 15.8. Deaths decreased (747) from 1978 resulting in a rate of 8.8 per thousand population, nearly identical to the rate of 8.7 per thousand population, nationally.

Although the infant and neonatal deaths rose slightly in number (760) and (564) this year, the rates per thousand live births are lower due to the increased number of births. The rates (10.8 for infants and 8.0 for neonatal deaths) are the lowest recorded in Massachusetts.

The number of fetal deaths reported decreased 14.1% from 1978. The law regarding the reporting of these events was changed in January of 1978 in an effort to improve the reporting. There has been no improvement thus far.

44,044 legal abortions were reported for 1979, an increase of 9.6% from 1978. This may be due to an increase in the number of women between the ages of 15 and 44 and a subsequent rise in the number of pregnancies.

Marriages increased 5% in 1979 while divorces increased 8.5%. The rates per thousand population for both are lower than the respective national rates of 10.7 marriages and 5.3 divorces per thousand population.

Tables in this section present breakdowns of vital events by month and location, as well as an historical comparison of natural increase rates in Massachusetts. Detailed statistics reflecting each specific type of event are displayed in succeeding sections of this report.

TABLE 1

SUMMARY OF 1979 VITAL EVENTS

The vital events involving Massachusetts residents in 1979 and 1978 compare as follows:

	1979	1978	Per Cent change
Live Births	70,568	68,526	+3.0
Fetal Deaths	475	533	-14.1
Infant Deaths	760	753	+ .09
Neonatal Deaths	564	552	+ .02
Total Deaths	51,797	52,544	-1.4
Marriages	45,010	42,882	+4.9
Divorces	17,523	16,156	+8.5
Abortions	44,044	40,200	+9.6

Note: Total deaths include infant deaths and neonatal deaths but do not include fetal deaths. Figures for marriages, divorces and abortions reflect occurrence, not residence.

NATALITY

Massachusetts resident births in 1979 increased to 70,568, 3% more than the 68,526 recorded in 1978. Male births accounted for 51.1% of total resident births. 6.1% of all births were of immature birth weight (2500 grams or less). Approximately 2% of all births were multiple births.

Teenage mothers accounted for 7,772 births, 11% of all births. Both the number and percent of teenage births continued to decline in Massachusetts. Although there is continuing interest in birthing centers and in at-home births, less than .6% of all births occurred in other than a hospital setting.

There were 60,021 babies born to married mothers. 10,547 babies were born to unwed mothers, representing 14.9% of total births and reflecting an increase of 7.7% since 1970. 30,969 babies (43.9%) were the first born to their mothers.

The Massachusetts fertility rate (births per 1000 women of childbearing age) was 50.4, again below the U.S. rate of 68. There were important differences in fertility rates for the various female age groups. The highest age-specific fertility rate is found in the 25-29 age group (93.8), followed by the 20-24 age group (74.2). All age groups showed slight increases in fertility rates from 1978 except for the youngest (15-19) and the oldest (40-44) which remained nearly the same.

Source: The 1978 and 1979 populations are interpolated from state populations projected by the Office of State Health Planning.

Note: The numerator of the births per thousand women represents the number of births to mothers in that age group. The denominator represents the number (in thousands) of women in that age group.

MORTALITY

There were 51,747 Massachusetts resident deaths in 1979, 747 fewer than in 1978. Heart disease continued as the number one cause of death, accounting for 40.3% of all deaths. Cancer (23%), cerebrovascular disease (8%), and accidents (4.3%) are the next leading causes of death. Both heart disease and cancer account for a higher percentage of deaths in Massachusetts than in the nation as a whole; even when these figures are age-adjusted to allow for differences in population composition. The percentage of deaths due to cancer has risen by over 4% in Massachusetts since 1970.

The leading cause of death varies by age. Non-motor vehicle accidents are the leading cause of death for the 1-14 year olds; motor vehicle accidents for the 15-34 year olds; cancer for the 35-64 year olds; and ischemic heart disease for the 65 and older group. Death rates for specific diseases also vary according to sex and race.

Data based on deaths certified by Medical Examiners are presented in this report for the first time. Before 1963, statistics on Medical Examiner certified deaths were presented annually, but these data were extracted from annual reports filed by Medical Examiners with the Secretary of the Commonwealth. Statistics are presented by county of occurrence and cause of death and for the state by cause, age, race and sex. 78% of the 14,291 deaths certified by Medical Examiners were due to non-violent causes and represent sudden or unattended deaths.

Death statistics presented by cause of death in this report are based on death certificates coded for underlying cause of death using the Ninth

Revision of the International Classification of Diseases, World Health Organization. The Eighty Revision was used in Massachusetts from 1969 through1978. When using these data for comparisons over time, care should be taken to identify which revision was in use during during the time period the data were collected. In the tables in this section, the numbers following the causes of death reflect the I.C.D. 9 code numbers for these causes.

The aggregated causes, however, reflect the aggregates used in the Eighth Revision and are therefore comparable with previously presented data.

INFANT AND NEONATAL MORTALITY

In 1979 the historical trend of decreasing rates of infant and neonatal mortality in Massachusetts continued. The overall number of infant deaths (under 1 year old) increased from 753 to 760 in 1979. There were 564 neonatal deaths (under 28 days old) in 1979, an increase of 12 deaths. However, though the numbers increased, because of the increase in the number of live births, the rates for neonatal deaths decreased to 8.0 per 1,000 live births and the rate of infant deaths decreased to 10.8 per 1,000 live births, both the lowest rates yet recorded in Massachusetts and both rates substantially lower than the comparable U.S. figures of 8.7 and 13.0 per 1,000 live births.

The majority (56%) of neonatal deaths occurred in babies under 1 day old. Deaths to babies under one week old constituted 85.6% of all neonatal deaths. Neonatal deaths represented 74.2% of infant deaths.

Neonatal mortality is strongly related to birthweight. Low birthweight babies (under 2500 grams or 5 pounds 8 ounces) accounted for 6.1% of all live births in 1979 but 78.9% of neonatal deaths were to low birthweight babies.

TABLE 23

RESIDENT INFANT AND NEONATAL DEATHS 1969-1979

YEAR	DEATHS UNDER 1 YEAR		DEATHS UNDER 28 DAYS	
	NUMBER	PER 1000 LIVE BIRTHS	NUMBER	PER 1000 LIVE BIRTHS
1969	1,699	18.3	1,353	14.5
1970	1,583	16.9	1,231	13.1
1971	1,462	16.8	1,130	13.0

1979	457	4,392	104.0	105	66,439	1.6	579	72,295	8.0

1. The figures used in this table can not be directly compared with other tables in this section. They are derived from those neonatal deaths where both births and death certificates are available (and hence may exclude out-of-state births or deaths). Neonatal deaths include deaths occurring less than 28 days after birth and therefore include some deaths thru January of the subsequent year. Births are based on Massachusetts occurrence births. These mortality trends are as comprehensive as it is possible to develop, based upon available vital events data.
2. All birthweights include some births and neonatal deaths of unknown weight and all weights over 4500 grams.

ABORTIONS

The Department of Public Health is authorized to collect abortion statistics under Chapter 111, Section 25A, of the Massachusetts General Laws. Sixty-four acute care hospitals, seven licensed clinics, and sixteen physician's offices reported to the Department in 1979.

There were 44,044 induced abortions reported during 1979, an increase of 3844 (9.6%) over the total of 40,200 in 1978, and an increase of 34.3% since 1976, the first year reported. The ratio of abortions to live births increased from 572 per 1,000 births in 1978 to 609 per 1,000 births in 1979; slightly more than 6 abortions for every 10 live births.

Over half (55.7%) of induced abortions were performed on women between the ages of 20 and 29. Women under the age of 20 accounted for 30% of all induced abortions. The ratio of abortions to births is highest for women under 20 and those 40 years of age and older, with both groups having more abortions than births.

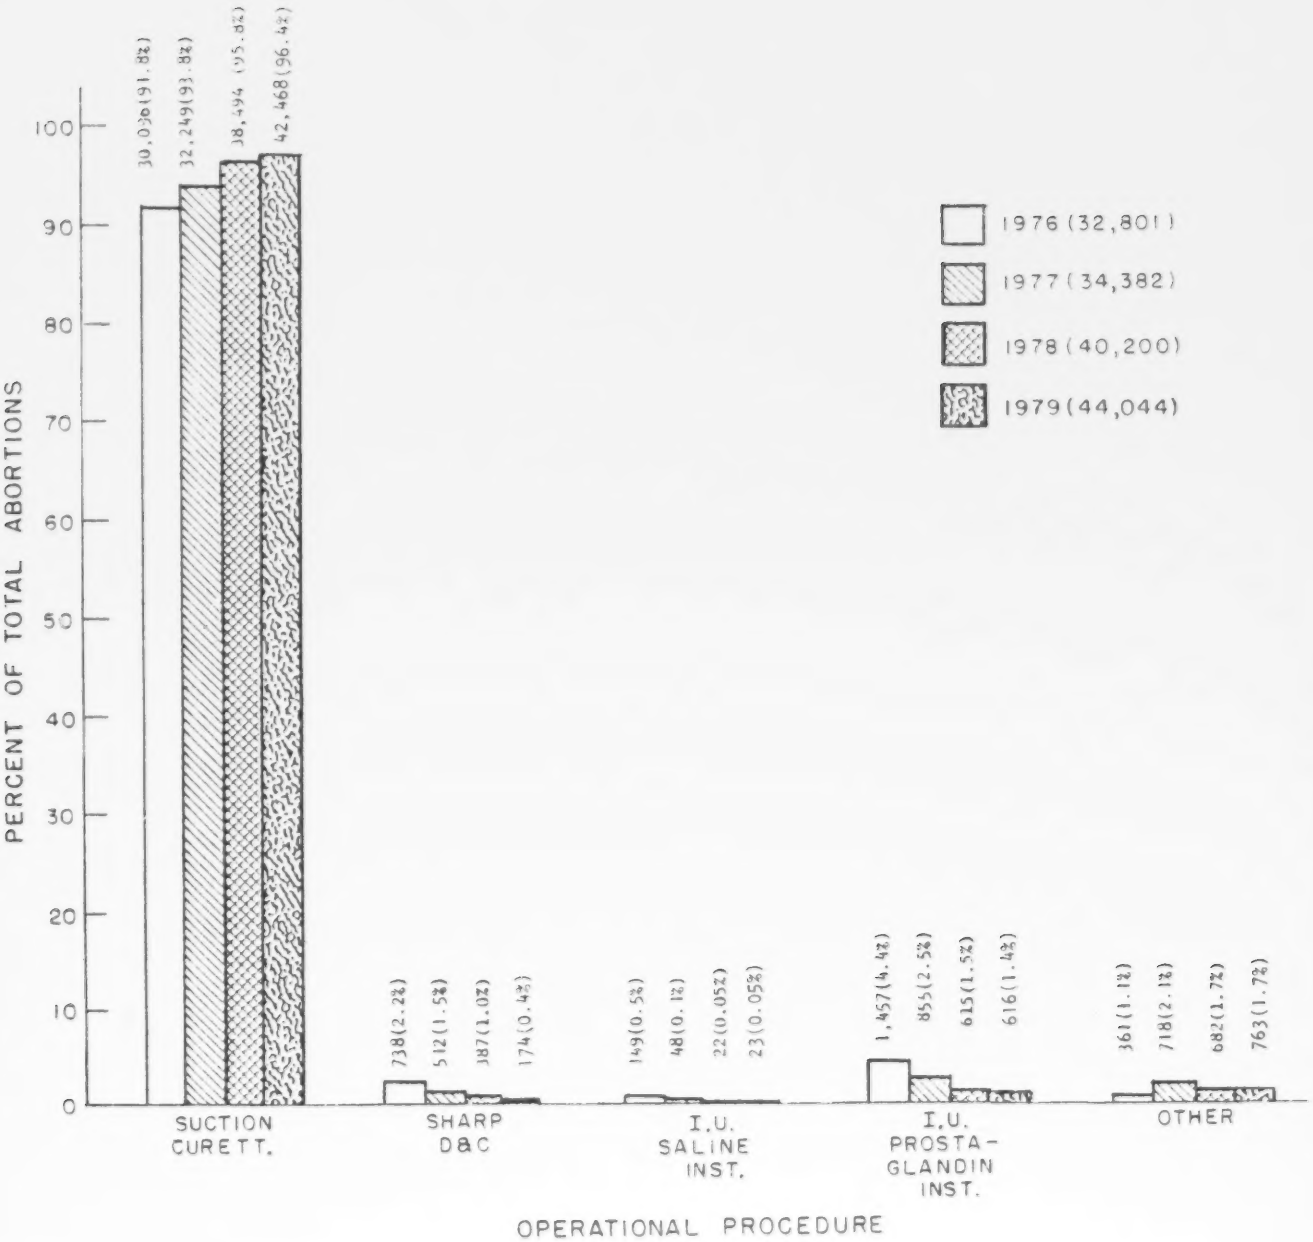
FIGURE 4

ABORTIONS BY PROCEDURE, 1976-1979



MARRIAGES AND DIVORCES

Marriages and divorces are reported from the place of occurrence in Massachusetts and not by the residence of the parties involved. Marriages and divorces which involved Massachusetts residents but occurred in other states are not included in these figures. There is no system of interstate information exchange for these events, as there is for births and deaths.

There were 45,010 marriages performed in the Commonwealth during 1979, an increase of 2128 (5%) over the 1978 figure, and resulting in a rate of 7.6 per 1,000 population. Of the brides, 77% had never been married before, 3% were widowed and 20% were previously divorced. The previous marital status of grooms was similar. 15.2% of the brides and 5.8% of the grooms were under the age of twenty.

There were 17,524 divorces granted in Massachusetts in 1979. This represented 1368 (8.5%) more divorces than in 1978 and reflects a rate of three divorces per 1,000 population.

POPULATION

The population tables presented in this section are based on the federal census for decennial years (1960,1970). For the inter-decile years (1965,1975) the Commonwealth enumerates its own census. The U.S. Bureau also puslishes a population estimate for the inter-decile years. The Commonwealth's figures are presented in the county population table for inter-decile years, while the Census Bureau estimates are presented for the 1975 population of towns and Health Service Areas.

It must be kept in mind that the state's definition of who is to be counted as a Massachusetts resident differs slightly from the federal definition. Generally, the state figures exclude students and military families residing in the Commonwealth. 1979 population estimates are not presented because detailed census estimates are not available on a yearly basis for political subdivisions of the state.

APPENDIX

APPENDIX I

REGISTRATION OF VITAL RECORDS

The data in this report is compiled by the Registry of Vital Records and Statistics, a unit of the Office of Health Statistics in the Department of Public Health.

Returns of births, marriages and death records are received in the Registry from the Commonwealth's 351 local municipalities (311 Towns and 40 Cities). Except for the City of Boston which has a City Registrar, the town or city clerk for each respective community serves as local registrar. Monthly, each local registrar transmits attested copies which make up the state file. These events have been filed in the Registry since 1841.

When a birth occurs at a hospital, the certificate is prepared by hospital personnel and transmitted to the local registrar within 10 days. For births which occur at home or without medical assistance, the parents are responsible for the registration. All birth records are signed by the attending physician and the parent to insure the accuracy of the data collected.

Marriage licenses are issued by the clerk of the city or town where the parties reside. If the prospective bride and groom reside in different communities, two licenses are issued. The person performing the marriage is required to complete the certificate and return it to the local clerks who issued the license.

A death certificate is initiated immediately after the death by the physician or medical examiner who records the deceased's name and complete cause of death. The remainder of the data is collected by the funeral director with the assistance of the informant, usually the next of kin. The funeral director than submits the completed certificate to the local board of health who issues the appropriate burial permit and further transmits the certificate to the local clerk.

Fetal deaths of 20 weeks or more gestation are required to be reported by the hospital where the death occurred, within ten days after death.

Summary reports of abortion are received monthly from Massachusetts facilities.

Divorces reports are received monthly from the Registers of Probate for the county in which the divorce was granted.

CERTIFIER

I HEREBY CERTIFY that this delivery occurred on the date stated and product of conception was not a live birth.

Signature of Attending Physician or Medical Examiner _____ TITLE

DEFINITION: "Fetal death" per chapter 111 section 202 of the M.G.L. means death prior to the complete expulsion or extraction from its mother of a fetus, irrespective of the duration of pregnancy, as indicated by the fact that after such expulsion or extraction the fetus does not breathe or show any other evidence of life such as beating of the heart, pulsation of the umbilical cord, or definite movement of voluntary muscles. A fetal death does **NOT** include an induced abortion as defined in section 12K of chapter 112 of M.G.L.. Spontaneous abortions are to be included.

TO BE REPORTED: Only fetal deaths of twenty weeks or more gestation or of a weight of 350 grams or more are to be reported.

INSTRUCTIONS: Return completed reported within 10 days to the Registry of Vital Records and Statistics, Rm. 107 McCormack Bldg., 1 Ashburton Pl., Boston, Ma. 02108

APPENDIX II

DEFINITIONS

The following definitions conform wherever possible to those of the National Center for Health Statistics, United States Department of Health, Education and Welfare.

BIRTHS

LIVE BIRTH - A live birth is the complete expulsion or extraction from its mother of a product of conception, regardless of the duration of pregnancy, which, after separation, breaths or shows any other evidence of life, such as beating of the heart, pulsation of the umbilical cord, or definite movement of voluntary muscles.

BIRTH WEIGHT - Weight of an infant or fetus at the time of delivery. It may be recorded in either pounds/ounces or grams; if it is the former, it is converted to grams for use in this report.

MATURE BIRTH WEIGHT - Weight at delivery which equals or exceeds 2501 grams.

IMMATURE BIRTH WEIGHT - Weight at delivery of 2500 grams or less. Immaturity rather than prematurity is used. Prematurity refers to gestational age and is difficult to ascertain reliably.

DEATHS

INFANT DEATH - Death of a person whose age is less than one year.

NEONATAL DEATH - Death of a person whose age is less than 28 days.

FETAL DEATH - A fetal death is death prior to the complete expulsion or extraction from its mother of a product of conception, irrespective of the duration of pregnancy; the death is indicated by the fact that after such separation the fetus does not breathe or show any other evidence of life, such as the beating of the heart, pulsation of the umbilical cord, or definite movement of the voluntary muscles.

Massachusetts law requires that fetal deaths of 20 or more weeks gestation be recorded; therefore, the fetal deaths referred to in this report are of that gestational age. In this report use is made of infant, neonatal and fetal deaths occurring to Massachusetts residents.

CAUSE OF DEATH - The underlying condition which gives rise to a series of events leading to death. The code used for identifying cause of death is the 8th Revised Edition of the International Classification of Disease, and the rules for applying the code are promulgated by the National Center for Health Statistics. (The 8th Revision was adopted by Massachusetts in 1969; care, therefore, should be used when comparisons of causes of death span two somewhat different sets of codes).

DEMOGRAPHIC

HEALTH SERVICE AREA - In accordance with the National Health Planning and Resources Development Act of 1974 (P.L. 93-641), Massachusetts is divided into six Health Service Areas (HSA's) for the purpose of planning and developing health services. Each HSA encompasses both metropolitan and non-metropolitan areas and contains at least one center for the provision of highly specialized health services.

HEALTH SYSTEMS AGENCY - A Health Systems Agency (HSA) is the public planning body which is responsible for the establishment and implementation of a comprehensive health systems plan within a particular service area. The purpose of the comprehensive plan is to improve the health of HSA residents, increase accessibility and quality of health services, restrain cost increase and prevent unnecessary duplication of health resources. The executive committee of the agency is composed both of consumers and providers of health care, with the consumers forming the majority. The consumer membership of the committee is chosen to be broadly representative of the social, economic, linguistic and racial populations, geographic areas of the HSA, and major purchasers of health care.

OCCURRENCE - The place where the event actually happened. In Massachusetts, place will be one of 351 towns/cities.

RACE - The mother's response to the question of her own and her husband's racial identity. The race of the baby is determined by consideration of the race (s) of the parents.

RESIDENCE - The usual place of residence as reported by the mother (for births) or the informant (for deaths). An infant's residence is considered that of its mother.

RATES

BIRTH RATE = $\frac{\text{No. of Resident Live Births}}{\text{Total Resident Population}} \times 1{,}000$

GENERAL FERTILITY RATE = $\frac{\text{No. of Live Births}}{\text{Total Female Population of childbearing Age (15-44)}} \times 1{,}000$

AGE-SPECIFIC FERTILITY RATE = $\frac{\text{No. of Resident Live Births for a Specific Age of Mother}}{\text{Total Female Population of Specific Age}} \times 1{,}000$

MORTALITY RATE = $\frac{\text{No. or Resident Deaths}}{\text{Total Resident Population}} \times 1{,}000$

FETAL MORTALITY RATE = $\frac{\text{No. of Resident Fetal Deaths}}{\text{Total Resident Live Births and Resident Fetal Deaths}} \times 1{,}000$

INFANT MORTALITY RATE = $\frac{\text{No. of Deaths at less than 1 Year of Age}}{\text{Total Resident Live Births}} \times 1{,}000$

NEONATAL MORTALITY RATE = $\frac{\text{No. of Deaths at less than 28 Days of Age}}{\text{Total Resident Live Births}} \times 1{,}000$

AGE-SPECIFIC DEATH RATE = $\frac{\text{No. of Deaths in Specific Age Group}}{\text{Total Resident Population in Specific Age Group}} \times 100{,}000$

CAUSE-SPECIFIC DEATH RATE = $\frac{\text{No. of Deaths from Specific Cause}}{\text{Total Resident Population}} \times 100{,}000$
